2024 Directory of EuroQol PhD Network Members

Version 3.0 – 1 January 2024

Joshua M. Bonsel, Jia Jia Lee, Benjamin M. Craig

Introduction

- EuroQol PhD Network was established in September 2022 for and by doctoral students conducting research on the measurement and valuation of health. The aim of the Network is to bring these students together and to offer a programme of activities to support their career development.
- The EuroQol PhD Network requires students to be actively enrolled in a doctoral program and conduct research aligned with the EuroQol scientific aims. A doctoral student must complete a brief application confirming the above-mentioned criteria, which is reviewed by the leadership of the Network (Joshua M. Bonsel, Benjamin M. Craig, Jia Jia Lee) and by the members of the Education and Outreach Working Group (EOWG) of the EuroQol Research Foundation.
- In September 2022, 21 students volunteered to be the founding members of the EQ PhD Network (see website). Since then, six members (Suzana Karim, Andrea Libório Monteiro, Maja Kuharic, Paul Schneider, Caique de Melo do Espirito Santo, Clement Cheuk Wai Ng) graduated, one member left their doctoral program, and 27 new member applications were approved (see below), doubling the Network membership (from 21 to 41 members [21-7+27]).

EQ PhD Network Membership

To promote social cohesion and networking, the 41 Network members have provided a brief description of themselves and their research (1 page each, structured format). In this directory, the members are listed by seniority, starting with the founding members followed by those who joined more recently. Some students have presented at EuroQol meetings, published articles on EuroQol instruments, or received grants from the Foundation. The founding and newer members used slightly different forms, but the general structure is similar. For reference, the Appendix is the Code of Conduct for the 2024 EQ PhD Network members.

Using this directory, we hope to showcase the qualities and diversity of the 2024 cohort. Please feel free to contact its members directly. You may also send queries to its leadership via email (phdnetwork@euroqol.org).
EUROQOL PHD NETWORK RECEPTION AT
THE 40TH EUROQOL PLENARY 2023,

<tr>
<td>PhD abstract</td>
<td>The EQ-5D is the most widely used generic instrument to measure, compare and value health status across disease areas. In the UK, the National Institute for Health and Care Excellence (NICE) has specified the EQ-5D as its preferred method of utility measurement and as such has become the cornerstone of Health Technology Appraisal (HTA) affecting important decisions about access to new medicines. Despite all this, EQ-5D data are often under-reported, and inadequately analysed. As such, the main aim of the PhD is to explore the analysis of EQ-5D data for economic evaluation. The main aim of this project is likely to cover the following key research questions.  • Uncertainty around EQ-5D values used in cost effectiveness analysis and methods to address them  • The concept of minimally important difference for a generic HRQoL instrument such as the EQ-5D  • Informative missingness of EQ-5D data when health fluctuates  • Impact of different modelling methods on EQ-5D data.  • Explore the use of the visual analogue scale component of the instrument to enhance analyses of the tariff values.  This research project will seek to extend the existing body of research on the design and analysis of EQ-5D data and add to the EuroQol Group body of research.</td>

| PhD abstract | In this PhD-project the potential of EQ-5D in Orthopedics is demonstrated, thereby enhancing use of the Dutch arthroplasty registry. The proposed research program not only enables a PhD achievement of the candidate, but will also build up an expertise center at the department of Orthopedics at the Erasmus Medical Center on the best use of the EQ-5D, and other available outcome measures. The proposal includes 5 projects.  
Working packages:  
1) Systematic review on use of PROMs specifically EQ-5D as quality improving tool, with a focus on Orthopedics  
2) Using Dutch arthroplasty registry data to show EQ-5D inequalities in Orthopedics  
3) Using Dutch arthroplasty registry data to study the impact of COVID-19 in Orthopedics  
4) A sub-study from the POPCORN-survey to illustrate the COVID-19 impact in the general population with joint disease  
5) A registry founding project in scoliosis children in which also the performance of the EQ-5D-A is compared to the EQ-5D-Y |

<tr>
<td>PhD abstract</td>
<td>Background: Low back pain (LBP) has been the leading cause of years lived with disability from 1990 to 2017. Despite the usefulness of spine surgery, there are wide variations in post-operative outcomes, and increased use of surgeries contributes to the heavy burden on health-care systems. Patient-reported outcome measures (PROM)-based patient decision support intervention (PDSI) guided by surgeons could potentially facilitate shared decision making. Aims: This project aims to develop and evaluate a surgeon-led, PROM-based PDSI for patients with LBP using an application that provides individualized postoperative health outcomes predictions (PRECEDE-LBP). Methods: Firstly, we will summarize the available evidence on the effects of PDSI on invasive treatment choice, decision-making related outcomes, PROs, and healthcare resource utilization outcomes using a meta-analytic approach. Secondly, we will conduct qualitative study to understand patients’ and surgeons’ perspectives on considerations and processes for decisions on elective surgeries for managing spine conditions and explore their views on a novel, web-based decision aid prototype. Thirdly, we will develop prediction algorithms through in-depth analysis of the existing patient-reported outcomes (PRO) and clinical data. With these findings, we will then develop the application and an implementation action plan for implementing the application in clinical practice by working with a multidisciplinary team, through iterative usability and pilot testing. Finally, we will assess the patient-centered effects of the PDSI in terms of decision quality and related outcomes, patient experience and satisfaction, and postoperative health outcomes using a cluster-randomized controlled trial design.</td>

**PhD abstract**
Background: EQ-5D is a popular generic health-related quality of life scale widely used in economic evaluation, clinical management, and research. However, its measurement properties in chronic obstructive airway conditions may be compromised by its limited dimensions, narrow time frame and severity-based questions. Specific examples of these conditions include asthma and chronic obstructive pulmonary disease (COPD) involving lower airways, and obstructive sleep apnea (OSA) affecting upper airways. The former relates to fluctuations and occurrences of flares which may not be adequately captured by the short time frame and severity-based responses, whereas the full impact of the latter may not be encapsulated by the scale's 5 dimensions. Aims: We therefore set out to critically appraise the psychometric performance of EQ-5D in major OAD. We investigate using longer timeframe periods, frequency-based responses, and bolt-on dimensions to enhance the measurement properties of EQ-5D in OAD. In addition, we will also explore the feasibility of delivering the instrument routinely in the clinical settings. Methods: We will perform systematic reviews to evaluate the psychometric performance of EQ-5D in chronic obstructive airway diseases and determine the most appropriate construct to bolt-on to EQ-5D in OSA. We will employ mixed methods with qualitative and quantitative designs - the former to explore alternative time frames and responses for asthma/COPD, and adequacy of bolt-on dimensions in asthma/COPD and OSA; the latter to assess the performances of these enhanced versions in the respective OAD. Similarly, we will use mixed method approaches to obtain stakeholders’ input on the best design for collecting EQ-5D data in a busy clinical setting and to test its feasibility and sustainability. Relevance & future research: We hope the enhanced versions can improve EQ-5D’s psychometric properties in chronic obstructive airway diseases to enhance its applicability and implementability in routine clinical settings. Further work may explore the utility of these enhanced versions as condition-specific preference-based measures.

| PhD Abstract | The project will explore the relative social value of child versus and adult QALY by analyzing qualitative data on the relative social value of improvements in child health compared to adult health that will be collected within the context of Person Trade off (PTO) and pairwise choice exercise conducted in Australia. The primary objective of this study is to provide useful evidence to decision makers in Australia to understand public opinion on the social value of child health gains relative to adult health gains. The study aims to (1) provide weights for the social value of improvements in both length of life and health-related quality of life for each age from birth to young adulthood (0-24) versus gains to an adult (aged 40), based on the stated preferences of the Australian general public; (2) provide a summary for decision makers of the views of a representative sample of the Australian public and of parents with children with a health condition to understand how they feel about valuing health gains differently based on youth; (3) understand any difference in child vs adult weights between: extending length of life and improving quality of life, improving different domains of quality of life (physical health vs mental health) and extending length of life for 2 years versus 5 years; (4) understand the strength of preference towards physical health gains for patients of different ages relative to any preference for favouring those with a limited life expectancy. Given the increasing use of Absolute Shortfall as a modifier for QALY gains this explores the relative weight to age versus overall length of life; (5) understand whether any preferences derived from trade-off questions are consistent with expression of attitudes in attitudinal questions and understand the reasons for any inconsistencies; (6) test the impact of different study designs relating to including an 'opt out' option versus forcing respondents to select a preferred age group within the choice question. Half the sample will be forced to express a preference between groups of patients of different ages within their first question and the other half will be able to express equivalence of value in all questions and (7) check data consistency through a 'chaining' test of preferences. |

**Year & Location** | Expected completion in 2025, Department of Psychiatry, Erasmus MC, Rotterdam, Zuid-Holland Province, the Netherlands  
**PhD abstract** | EQ-5D was found to have a high ceiling effect and be insensitive in detecting differences in health status in China. In recent years, the legitimacy of applying EQ-5D in the Chinese cultural setting has been questioned. Given health can be conceptualized differently in China, it can be argued that EQ-5D may miss some important questions for Chinese populations in describing health. However, no systematic investigations into this potential issue have been made and what important health dimensions to Chinese but not included in EQ-5D remains unknown.  
This study aims to systematically review relevant studies on the Chinese concepts of health and health-related quality of life, in order to identify those important health dimensions in a Chinese cultural setting but have not been included in EQ-5D.  
A scoping review will be undertaken to attain the research aim. First, a systematic literature search will be conducted in Chinese databases CNKI and Wanfang, as well as English databases EMBASE, MEDLINE and the EuroQol Asian Academy meeting proceedings. We will review articles on the following topics: 1) reporting HRQoL measures that were developed in a Chinese cultural setting; 2) constructing a conceptual framework of health or health-related quality of life specifically to Chinese culture; 3) conducting qualitative interviews to explore Chinese people’s understandings of health. Second, two bilingual reviewers will screen titles, abstracts and full-text articles independently. Third, data will be extracted and synthesised. Fourth, a list of potentially important health dimensions that are not covered by EQ-5D will be identified.

| PhD abstract        | The EQ-5D-Y instrument is a developing field in terms of instrument validation and method of valuation. To bring evidence for the validity of EQ-5D-Y-5L and also the valuation method for EQ-5D-Y-3L, my PhD project had several research aims:  
  (i) Testing the psychometric properties of EQ-5D-Y-3L and EQ-5D-Y-5L (self-report and proxy versions) in pediatric patients;  
  (ii) Testing the current valuation method of EQ-5D-Y-3L;  
  (iii) Provide the population norms for both EQ-5D-Y instruments in Indonesia. As a follow-up of my study findings, one research project has been granted by the EuroQol that aims to investigate the rationale of adults’ responses in valuating children’s health state. |

I am a PhD student with the Health Economics Unit at the University of Melbourne, and my research is focussed on the measurement of paediatric health related quality of life (HRQoL) and paediatric patient reported outcome measures (P-PROMs). I hope to explore the clinical utility of the EQ-5D-Y as a routine PROM in managing clinical care in a tertiary paediatric children's hospital. I have previously completed a Bachelor of Science and Master of Public Health. Prior to starting my PhD in 2022, I was a Research Assistant with the Health Services and Economics group at the Murdoch Children’s Research Institute, working across a range of research areas (HRQoL, mental health, asthma, childhood adversity, HTA assessment).

**PhD abstract**  
Background: Increasingly clinicians, health service providers and patients see value in the use of patient reported outcome measures (PROMs) to inform clinical practice. As a short generic health measure, validated across a wide age range and with strong psychometric properties, the EQ-5D-Y is a promising tool for routine use as a clinical PROM for children. There is a paucity of research regarding the use of PROMs in children and the use of EQ-5D-Y as a clinical PROM.  
Aims: This PhD aims to assess the clinical utility of the EQ-5D-Y as a routine PROM in managing clinical care in a tertiary paediatric children's hospital.  
Methods: A knowledge to action framework will inform a four stage, mixed methods approach: 1) assessment of the performance of generic paediatric HRQoL instruments (including EQ-5D-Y) across a range of child age groups, health groups (chronic condition versus acute condition versus general population), and settings (hospital versus community), 2) comparison of paediatric condition specific and generic instruments across a range of child age groups and health groups (chronic condition versus acute condition), 3) co-design preferences for PROM integration with families and clinicians, and 4) pilot two alternative methods of presenting the EQ-5D-Y as a PROM to clinicians and families in a number of tertiary paediatric hospital outpatient clinics.  
Relevance for the EuroQol Group: Develop guidance for extended and sustained use of EQ-5D-Y in tertiary paediatric practice, including international extensions.

| PhD abstract | This proposal has two objectives towards investigating the performance of the maximum simulated likelihood (MSL) estimator and comparing its performance to the Bayesian estimator. First, Jumamyradov and Munkin (2020) show that the MSL estimator leads to serious inferential biases under the bivariate normal and bivariate Poisson models. I will apply a similar approach to investigate the performance of the MSL estimator under the mixed logit model with and without inter-alternative correlations. Second, I will compare the performance of the maximum simulated likelihood (MSL) and Bayesian Markov chain Monte Carlo (MCMC) estimators under different specifications of the mixed logit model. I hypothesize that their relative performance depends on the specification, namely the number of random parameters and various taste patterns. I will also analyze how the MSL estimator performs in presence of random ancillary parameters that account for scale and discount heterogeneity. There are two main aims of this proposal: (1) Investigate the performance of the maximum simulated likelihood (MSL) estimator in (1a) the bivariate normal and Poisson models, and (1b) the trinomial logit model with inter-alternative correlations (substitution patterns) that violate the independence from irrelevant alternatives (IIA) property. (2) Compare the performance of the MSL and Bayesian estimators of the hierarchical-mixed logit model using simulated and empirical panel data (2a) with different numbers of independent random coefficients (2b) under different specifications of random coefficients (taste patterns) (2c) with random parameters that account for scale and discount heterogeneity. |

<td>PhD abstract</td>
<td>Background: The low utilization rate of bariatric surgery (BS) and the decision dissonance among BS recipients suggest that the current decision quality is suboptimal. The existing patient decision aids (PtDAs) for BS focuses on clinical outcomes. Information about health-related quality of life (HRQoL) following BS is absent. The existing PtDAs also lack a decision-making tool that helps the users make a decision that aligns with their personal values. A PtDA with both the clinical benefits and changes in HRQoL could potentially help patients considering BS make a quality decision. Aim: To explore the potential of an EQ-5D-based PtDA in improving decision-making of individuals considering BS. Methods: Study 1: Qualitative interviews involving patients considering/having rejected/received BS and healthcare professionals who provide consultation/counselling to obese patients considering BS. Study 2: Clinical and demographic data and routinely collected EQ-5D data of BS recipients will be analyzed to identify the preoperative predictors of post-operative EQ-5D outcomes. Study 3: A cross-sectional study will be conducted with adult patients who are qualified for BS but were on non-surgical treatment to understand the baseline predictors and the magnitude of improvement in EQ-5D outcomes 3-6 months post-treatment. Study 4: A web-based PtDA will be developed based on the findings from Studies 1 and 2. Study 5: The effectiveness of the PtDA will be pilot-tested by comparing a comparison arm and an intervention arm. This project echoes the aim of the Population and Health Systems Working Group by promoting and enhancing the use of EQ-5D as the major component of a PtDA for patients considering BS. This research would generate scientific evidence about the application of EQ-5D data collected in routine clinical practice to facilitate shared decision-making and to translate into enhanced clinical and patient-reported outcomes.</td>

PhD abstract | In cost-effectiveness analysis, health outcomes are measured using a utility scale where 1 corresponds to full health, 0 corresponds to being dead, and negative values for worse-than-dead (WTD) health states. While health-state valuation methods have advanced significantly in the past decades, they do not work well in measuring the utility of very poor health outcomes. This project aims to explore new methods for the valuation of very poor health outcomes for cost-effectiveness analysis of health technologies. The project will apply mixed methods and analyse both primary and secondary data. Briefly, a total of four studies are planned. Study 1 is an investigation into censoring issue of composite time trade-off (cTTO) tasks using a time-based willingness-to-accept question. Study 2 is a qualitative investigation of the thought processes for valuing WTD health states in cTTO tasks. Study 3 and 4 is an empirical testing of a novel TTO method which uses the pits state ‘55555’ as the anchor state (referred to as ‘pTTO’). The project is expected to contribute to knowledge on the challenges in eliciting negative health-state utility. The new TTO methods are expected to improve valuation of WTD health states for cost-effectiveness analysis of health technologies.

| PhD abstract | Preference-based measures (PBMs) for measuring health-related quality of life (HRQoL) provide a convenient approach to derive health state values for the calculation of quality-adjusted life-years (QALYs) needed for cost-utility analysis (CUA) of health interventions or technologies. HRQoL data generated from PBMs can also be used to estimate the humanistic disease burden of paediatric conditions. To date, no such instrument has been made available for use in paediatrics in Singapore. EQ-5D-Y is a PBM suitable for use by children and adolescents. EQ-5D-Y has demonstrated good measurement properties in multiple paediatric populations. However, whether the EQ-5D-Y is valid, reliable and responsive in Singapore is unknown. In addition, no value set has been developed for EQ-5D-Y for use in the local context. Local value sets are preferred for calculation of QALYs in CUA. The overall aim of my project is to make preference-based HRQoL instruments available for use in paediatrics in Singapore. The specific aims of the project are: 1) to culturally adapt EQ-5D-Y or use in paediatrics in Singapore; 2) to assess measurement properties including validity, reliability, and feasibility of EQ-5D-Y in children and adolescents with asthma and eczema in Singapore; 3) to develop a local EQ-5D-Y value set for use in Singapore. The project will be conducted in two phases. In the first phase, EQ-5D-Y will be culturally adapted for use in Singapore following the standardised translation protocol provided by the EuroQol Group. In the second phase, validation of the EQ-5D-Y in children and adolescents with asthma and eczema will be conducted. Concurrently, valuation will be done for EQ-5D-Y in the local public to develop an EQ-5D-Y value set for use in Singapore following the EQ-5D-Y valuation protocol recommended by the EuroQoL Group. |

<tr>
<td>PhD abstract</td>
<td>The goal of this PhD project is to improve health measurement and valuation for children and adolescents in Ethiopia. Specific objectives include: To compare psychometric performance of two measures of child health (EQ-5D-Y-3L and -5L); To explore whether the measurement properties are sustained across modes of administration self-report (interviewer assisted and self-complete), and proxy report; To generate an EQ-5D-Y-3L value set, reflecting how good or bad different child health states are according to the Ethiopian adult and adolescent population using the international valuation protocol; And to investigate whether children experiencing a health state and adults have the same idea about how good or bad those outcomes are. The Ethiopian Federal Ministry of Health has introduced a public health insurance system and aims to support healthcare financing with principles of HTA. The current practice of HTA for regulatory and formulary development is based on expert opinion and published HTA studies from other countries. This recent development of the HTA system recommends the use of societal preferences for valuing health states and social health insurance. However, local value sets are not yet available for children and adolescents. Therefore, there is a rising need for research on youth health measurement and valuation in this country.</td>

| PhD abstract | There is a growing interest in measuring patient-reported outcomes (PROs) in clinical research. The EQ-5D-5L has been often included to supplement disease-specific PRO instruments in randomized clinical trials (RCTs). The EQ-5D-5L data, if analyzed properly, can produce important evidence for two purposes: estimating the treatment effect between arms and deriving health utilities to support economic modeling. However, the analysis and reporting of the EQ-5D-5L in RCTs is rather limited, due at least in part to the lack of methodological guidance in analyzing utility data. Among those RCTs with published EQ-5D data, there is noticeable heterogeneity in choosing statistical models for data analyses. This PhD project aims at producing empirical evidence in comparing a wide range of statistical models in estimating treatment effect using the EQ-5D-5L and deriving health utilities for economic models. Furthermore, the output from this research program can be used to develop practical guidances on analyzing the EQ-5D-5L in the RCT setting. Such guidances can potentially improve the quality of analyzing and reporting the EQ-5D-5L in this context. |

| PhD abstract | EQ-HWB is a new generic instrument designed to capture health outcomes in mental diseases, well-being and social care. Additionally, it has the potential of generating QALY for conducting research in health economics. Given that EQ-HWB is developing, therefore, it still needs to conduct research on psychometric properties and to conduct a variety of research. On the other hand, the Chinese have a different concept of health and there is not much research on exploring Chinese populations’ psychological characteristics. Hence, I want to conduct some research on measuring health concepts, on psychometric properties of EQ-HWB. Furthermore, I want to research psychological characteristics in different ages and areas in the Chinese population by combining EQ-5D-5L and EQ-HWB. |

| PhD abstract | The EQ-5D is the world’s leading instrument to measure health related quality of life in health economic evaluations of health care interventions. Health economic evaluations are used in health care policy aimed at increasing the effectiveness of health care and to reduce differences in health between populations (equity). We propose to work with the EuroQol Group to deliver a state-of-the-art EQ-5D questionnaire (youth version, EQ-5D-Y) suitable for use by children and adolescents in China. This instrument will aim to produce valid quality of life values of children and adolescents in China that can be used in health economic evaluations. This would be of great significance as there is a growing need to assess the cost-effectiveness of health interventions for young populations. It will also push the scientific development of the EQ-5D in China to the international frontier of the sciences. This PhD project aims to identify 3 research questions which are relevant to China and the EuroQol Group in validating the new version of the EQ-5D: 1) What are the psychometric prosperities, specifically, validity and reliability, of the Chinese version of EQ-5D-Y for China in children and adolescents? 2) How should existing valuation methods be adapted for use in the Chinese low aged population? How does the EQ-5D-Y proxy version perform in these populations? 3) Can the instrument produce valid quality of life values of children and adolescents in China that can be used in health economic evaluations, specifically in children with chronic diseases such as haematological malignancies, juvenile rheumatic diseases and allergic diseases? |

Supervisors (roles): Prof. Rosalie Viney (Primary supervisor); Prof. Deborah Street (Co-supervisor); A/Prof. Brendan Mulhern (Co-supervisor)

PHD ABSTRACT
Economic evaluation is an essential tool that guides the way in which scarce health care resources are allocated within the health sector. A Quality Adjusted Life Year (QALY) is a metric that combines length of life and quality of life (QoL); and is used to conduct cost utility analyses (CUA) of healthcare interventions. Assessment of QoL is often more focused on the health-related aspect and other aspects such as social care related QoL (SCRQoL) are often not measured and or not valued enough. My PhD explores the methods for broadening the measurement of QoL by investigating the relationship between health related QoL (HRQoL) instruments like EQ-5D and SCRQoL instruments like ASCOT. Primarily, the PhD work explores statistical mapping methods to map between the two instruments and a combined instrument. This research work will provide evidence on the impact of using a more holistic instrument for health sector decision making.

PHD ABSTRACT
A dashboard is a data-driven clinical decision support tool capable of querying multiple databases and providing a visual representation of key performance indicators in a single report. The use of PROMs in clinical dashboards supports the clinician's understanding of how treatments impact symptoms scores and it enables the identification of health-related quality of life (HRQoL) deterioration or improvement at an early stage. In the previous literature, mostly the benefit of using disease-specific PROMs in combination with clinical dashboards has been highlighted. In the context of this research area, the EQ-5D has only rarely been used. To fill this gap, this project aims to evaluate the success factors of the design principles concerning clinical dashboards including generic – i.e., the EQ-5D – and disease-specific PROMs. To evaluate differences in the clinical dashboards' requirements for specific disease areas, the investigation of the clinical dashboard's potential is focused on a one-time intervention (i.e., hip and knee arthroplasty) and the long-term management of a chronic disease (i.e., COPD). To investigate the research question, a literature review is conducted to shed light on focus aspects for the subsequent expert interviews. These findings will be used for the development of prototypes, which finally will be discussed by focus groups. The contribution of this research project is threefold: first, the elaboration of the success factors of clinical dashboards based on a literature review and expert interviews; second, the inclusion of the EQ-5D in combination with disease-specific PROMs into the dashboard, with a design that enhances the clinician's understanding of the patient's health status; third, the development of prototypes for both the one-time intervention and the chronic disease case and their evaluation in the focus groups, which will form the basis for building and developing the future "real" clinical dashboards.

PHD ABSTRACT
Title: Valuing the outcomes associated with genome sequencing in economic evaluations.

Background: Genome sequencing is an advanced technology that can be used to predict, screen for, and diagnose diseases (including rare diseases, cancers, and infectious diseases), as well as identify drug targets. However, the information uncovered by genome sequencing (including incidental findings) is complex and can positively and negatively impact patients and families across clinical, emotional, cognitive, behavioural, and social outcome domains. Concerns in the context of health economics include understanding which outcome measurement instruments are best suited to facilitate the appropriate translation of genome sequencing into routine care. If the full impact of genome sequencing is not considered, this technology could be under- or over-utilised, creating inefficiencies through delayed or inaccurate diagnoses, forgone productivity, and unnecessary tests.

Aims and impact: My DPhil will determine the instruments best suited to measuring outcomes from genome sequencing for rare disease diagnosis. The findings from this DPhil will provide researchers and HTA organisations – such as NICE – with guidance on the type and magnitude of outcomes from genome sequencing in the rare disease population, and how best to measure them. The knowledge and guidance generated from this DPhil could be used by these groups when deciding which outcome measurement instruments should be used to evaluate genome sequencing for rare disease diagnosis, or when interpreting the results of widely used instruments that may under-measure key outcome domains within this context. Improved outcome measurement may lead to more efficient allocation of health system funds.

I have worked across multiple research projects including: COVID-19 modelling in AUS/NZ, NCD surveillance systems (Thailand), TTO experiments, and sudden cardiac arrest in the young in AUS. I also have two-years of work experience in the forensic services.

DOCTORAL PROGRAM
Health Economics Unit | Centre for Health Policy, Melbourne School of Population and Global Health, the University of Melbourne, Victoria, Australia, Expected completion in 2025
Supervisors (roles): Kim Dalziel, PhD (Primary Supervisor); Nancy Devlin, PhD (Secondary Supervisor)

PhD ABSTRACT
Few preference-weighted health-related quality-of-life (HR-QoL) measures exist for young children under 5 years of age. Young children are substantial consumers of healthcare services. EuroQoL’s EQ-5D-Y is a commonly used preference-based instrument to generate generic health state utility scores and QALYs for children above five, however, there is limited evidence on the acceptability and reliability in children between 2-4 years of age.

Dalziel et al (unpublished) recently conducted a qualitative study where an adapted version of the EQ-5D-Y (3L and 5L) was co-designed through focus groups of parents with young children (aged 2-4) alongside expert input. The findings showed that the adapted EQ-5D-Y has improved relevance and acceptability for 2–4-year-olds and appears easy to complete.

This PhD project will firstly aim to review the psychometric properties of EQ-5D-Y-3L and EQ-5D-5L compared to its most recently adapted version for young children between 2-4 years of age who are administered side by side measures. Secondly, this project aims to conduct think aloud interviews to try to uncover and explore how adults think when asked to conduct discrete-choice experiments (of the above instruments) while thinking about a young child aged 2-4years. Further, assess whether adults with young children are more appropriate to generate a utility value set compared to the general population. Thirdly, the project aims to synthesise the information from the think aloud study to complete a valuation study of the newly adapted EQ-5D-Y-3L/5L. Finally (time permitting), this project aims to explore how we measure a child’s HR-QoL as they age and transition across the suite of EuroQoL instruments – ie. Moving from EQ-TIPs (0-3) to the adapted EQ-5D-Y (2-4 years) to the EQ-5D-Y (5+).

I have a Master’s of pharmacy degree, and an MSc in health economics and health policy. Before enrolling on my PhD, I worked as a research associate at the centre of health economics at the University of Manchester (MCHE). During my time at MCHE, I worked on several clinical trials, including an international multi-centre trial of a non-pharmacological intervention for people living with dementia (PlwD). I am also a registered and practicing community pharmacist. Since enrolling on my PhD at the University of Sheffield, I have concurrently worked on several wider projects, including interviewing for the new EuroQol instrument - EQ-HWB (EQ Health and Wellbeing instrument) and an internship with DementiaUK. My PhD research is focused on how best to capture EQ-5D in dementia studies for use in economic evaluations.

DOCTORAL PROGRAM

PhD ABSTRACT
EQ-5D is widely used to capture health-related quality of life, and through systematic reviewing, is shown to exhibit strong psychometric properties for use in dementia populations. However, as a person living with dementia’s condition progresses, their ability to accurately self-report becomes more challenging - leading to a reliance on proxies. It is well established that PlwD-self and proxy reported EQ-5D do not align, particularly for the more “subjective” dimensions, and at the more severe stages of dementia. Therefore, the key issue is that the extent to which either proxy or patient reports reflect “true” utility is likely to differ by disease severity. Data from three existing dementia trials has been acquired for secondary data analyses. The key objectives of this PhD thesis are to: 1) produce a guideline on how best to collect quality of life data in dementia trials and studies, focusing on pragmatic factors, 2) use statistical mapping techniques to map from proxy rated EQ-5D to the equivalent PlwD-self rated values in an attempt to retain people living with dementia as central in the discussion, where self-ratings may no longer be feasible, and 3) use psychometric techniques i.e., IRT and Rasch analysis to understand which EQ-5D dimensions are responded to differently by people of different characteristics, mainly focusing on disease severity

PHD ABSTRACT
Many health care systems are increasingly considering the patient’s voice in assessing quality of care. Like many other healthcare interventions, knee replacement surgery is one of the procedures where patient-reported outcomes are more and more important. Osteoarthritis, the major reason for knee replacement surgery, affects over 15% of Canadians, mostly women, the elderly, and low-income earners. Of patients with osteoarthritis, nearly one in five will require surgery. However, almost one-third of individuals who have surgery will be dissatisfied with their outcomes partly due to unmet expectations. To help patients make better decisions, and ensure realistic expectations before surgery, an individualized patient decision aid that considers patients’ perspectives has been developed. Patients who used this decision aid have been shown to have twice the odds of making quality decisions than those who did not. Plans are now underway to integrate this decision aid into all bone and joint clinics in Alberta. However, it is unknown if the decision aid is suitable for large-scale routine use in its current form. Also, further evidence of its effectiveness is required to justify its continued routine use and potential scale up to other jurisdictions in Canada and beyond. To bridge this evidence gap, my research aims first to generate updated evidence on the effectiveness of measures that consider patients’ assessment of their health in improving the quality of care. The updated decision aid will be subjected to usability testing to determine if further adaptation is needed. Lastly, the effectiveness of the decision aid will be evaluated once introduced into large-scale routine care. Overall, this research will provide evidence on quality-of-care domains mostly impacted by measures that consider patients’ health assessment and how effectiveness studies can be improved. Findings will also inform a fit-for-routine-use decision aid and can inform the scale-up of the decision.

As a PhD student at Flinders University, Australia, I am investigating proxy vs child discrepancies in the measurement of paediatric health related quality of life (HRQoL) and the self-report capacity in children using generic preference-based instruments including the EQ-5D-Y-3L. Prior to this, I completed my master’s degree in Health Economics at the University of Queensland (UQ) with high distinction. Working as a Research Assistant has been a part of my past and present work experience.

DOCTORAL PROGRAM
Caring Futures Institute, College of Nursing and Health Sciences, Flinders University, SA, Australia, Expected completion in 2023
Supervisors (roles): Julie Ratcliffe, BA (Hons), MSc, PhD (Professor, Health Economics); Jyoti Khadka, B Opt, M Phil, PhD (Senior Research Fellow); Christine Mpundu-Kaambwa, BA, MSc, PhD (Research Fellow)

PhD ABSTRACT
Background: In health economics, generic preference based HRQoL instruments are commonly applied and self-assessment of HRQoL by the person themselves is preferred wherever possible. However, obtaining valid self-assessments of HRQoL in paediatric populations is challenging, particularly during the early stages of childhood and for children with a range of physical, intellectual and/or behavioural impairments. As a result, proxy (parent and/or healthcare professional) assessments of HRQoL are frequently utilised instead of child self-assessments. Aims: This research will apply a novel mixed methods approach incorporating qualitative think aloud and a quantitative eye tracking approach to investigate: [1] the feasibility and acceptability of child self-assessment of HRQoL for a community-based sample of children aged 6-12 years [2] the concordance between child self and parent proxy assessments of childhood HRQoL using three generic HRQoL measures designed for application in paediatric populations including the EQ-5D-Y-3L. Methods: A primary cross-sectional study will be conducted through a series of face-to-face semi-structured interviews with parent and child dyads (ages 6-12; N=85 dyads) including children living with and without a variety of health conditions and children from lower and higher socio-economic backgrounds. A mixed methods approach will be developed and applied to facilitate a detailed investigation of the feasibility and acceptability of child self-assessment of HRQoL and the level of child and parental agreement in the measurement of the HRQoL of the child using innovative eye-tracking technology and a qualitative ‘think aloud’ approach. Outcomes: This research will add significant new knowledge and contribute to methods of best practice and guidance for informing self and proxy assessment of children’s HRQoL for economic evaluation and quality assessment.

Yiting Luo is currently a PhD student in the Centre for Health Economics Research and Evaluation at University of Technology Sydney. She has a Master of Public Health degree specializing in Applied Biostatistics from Columbia University and had been working as an epidemiologist focused on chronic diseases prevention from 2018 to 2020. Her research interests are measurement and valuation of pediatric health-related quality of life and discrete choice experiments (DCEs).

DOCTORAL PROGRAM
Centre for Health Economics Research and Evaluation, Faculty of Health, University of Technology Sydney, New South Wales, Australia, Expected completion in 2025
Supervisors (roles): Brendan Mulhern, PhD (Associate Professor); Deborah Street, PhD (Professor); Rosalie Viney, PhD (Director, Professor)

PHD ABSTRACT
Conventional methods of valuing adult preference-based measures need to be adapted for use in the valuation of pediatric generic preference-based measures (GPBMs). Methodological issues have been discussed in many literatures around how to value pediatric preference-based measures, for example, whose preferences (child/adolescent, parent, or taxpayer), what appropriate formats for the questionnaire are, and which perspectives should be used (self or other). Further work is required to understand this, and also the ability of the target population to comprehend and complete the valuation tasks. The aim of the PhD project is to explore how pediatric populations choose between various aspects of health as included in a number of widely used GPBMs. This will be done using online Discrete Choice Experiments (DCEs). Results will help to strengthen the tools used to evaluate health outcomes to inform healthcare decision-making in pediatric populations. The PhD project is part of the QUality OF Life in Kids: Key evidence to strengthen decisions in Australia (QUOKKA) program.

PHD ABSTRACT
I am currently a co-investigator for the EQ-5D-Y-3L valuation study in the US (Co-PIs: Simon Pickard and Ning Yan Gu; #409-RA). I presented our preliminary work of engaging US stakeholders in a roundtable discussion at the 2022 Plenary meeting. Relatedly, I am investigating data quality and sources of preference heterogeneity among adolescent respondents to DCE valuation tasks. I am also interested in alternative approaches to anchoring DCE-derived latent scale values onto the QALY scale, including alternative preference elicitation methods to cTTO in valuing child and adolescent health related quality of life. This research has implications for end-users of EQ-5D-Y-3L value sets in the context of economic evaluation and health technology assessment, and may inform valuation protocols for future youth instruments.

PhD ABSTRACT
Adult QALYs are widely generated, used and accepted in healthcare decision-making, however this is not the case for children. Much of children’s healthcare decision-making – both internationally and in Australia – relies on adult-based evidence. Specifically, in children’s mental healthcare, there is a lack of health-related quality of life (HRQoL) data to support evaluations of the effectiveness of interventions, despite calls for the routine collection of these data. This lack of evidence ultimately risks a misallocation of vital healthcare funding. However, before we can routinely, validly and reliably measure HRQoL in child and adolescent mental health settings, there are several key challenges and evidence gaps that must be faced. Not least of these challenges is the question of whether HRQoL data – and the traditional definition of value based on costs and QALYs – is sufficient and appropriate to understand the value of children’s mental healthcare, or whether there are other, potentially more important, outcomes that should define ‘value’ in this context. Three key aims of my work, relevant to the EuroQoL Group are: (1) exploring the validity and reliability of different preference based HRQoL measures (including the EQ-5D and EQ-5D-Y) in children and adolescents with mental health challenges; (2) exploring the extent of the conceptual and measurement overlap between measures of HRQoL and measures of mental health symptoms; and (3) understanding the ‘value’ of mental health interventions based on the priorities of consumers and carers. With relevance for the EuroQoL group, I ultimately aim to contribute to contemporary debates by providing information that is relevant to health policy, clinical decision making and patient outcomes research, in terms of how we best define value in children's mental healthcare, and how we best measure HRQoL in children and adolescents with mental health challenges.

PHD ABSTRACT
A dashboard is a data-driven clinical decision support tool capable of querying multiple databases and providing a visual representation of key performance indicators in a single report. The use of PROMs in clinical dashboards supports the clinician’s understanding of how treatments impact symptoms scores and it enables the identification of health-related quality of life (HRQoL) deterioration or improvement at an early stage. In the previous literature, mostly the benefit of using disease-specific PROMs in combination with clinical dashboards has been highlighted. In the context of this research area, the EQ-5D has only rarely been used. To fill this gap, this project aims to evaluate the success factors of the design principles concerning clinical dashboards including generic – i.e., the EQ-5D – and disease-specific PROMs. To evaluate differences in the clinical dashboards’ requirements for specific disease areas, the investigation of the clinical dash-board’s potential is focused on a one-time intervention (i.e., hip and knee arthroplasty) and the long-term management of a chronic disease (i.e., COPD). To investigate the research question, a literature review is conducted to shed on light on focus aspects for the subsequent expert interviews. The findings from the prior steps will be used for the development of prototypes, which finally will be discussed by focus groups. The contribution of this research project is threefold: first, the elaboration of the success factors of clinical dashboards based on a literature review and expert interviews; second, the inclusion of the EQ-5D in combination with disease-specific PROMs into the dashboard, with a design that enhances the clinician’s understanding of the patient’s health status; third, the development of prototypes for both the one-time intervention and the chronic disease case and their evaluation in the focus groups, which will form the basis for building and developing the future “real” clinical dashboards.

PhD ABSTRACT
Widening the classification system of preference-based measures to capture aspects beyond health becomes a focus of research. The newly developed measure EQ-HWB and EQ-HWB-S are representatives. However, measures with a larger number of attributes present challenges for the valuation methods used to elicit the value set. Participants and researchers need to consider the cognitive burden caused by the large amount of information presented. Although not fully tested with the EQ-HWB measure, the DCE method has been considered a feasible option to meet the valuation challenges raised. The method has been used in published valuation studies with large number of attributes and classification systems including overlapping concepts. The PhD project intends to further discuss its feasibility with EQ-HWB measure. The study consists of three parts: 1) Literature review of DCE valuation methods. 2) Qualitative study to finalize the DCE design and presentation method. 3) The pilot and large-scale DCE survey with the UK and Australian samples. This study will contribute to the DCE methodological development in the field of health state valuation, as well as instruct future EQ-HWB valuation studies in other countries.

Biography

Jiabi Wen is a Ph.D. student at the University of Alberta and a research trainee at the Alberta PROMs and EQ-5D Research and Support Unit (APERSU). She obtained her MSc degree in Health Policy Research at the University of Alberta in 2020 and her BSc (Math) and BEcon (Economics) degrees from the Renmin University of China in 2018. Her research interests include economic evaluation and quality of life measures, particularly EQ-5D. Her Master's thesis focused on mapping for the EQ-5D-5L. In her Ph.D. studies, she is working on her thesis on the economic evaluation of wastewater surveillance. She is also involved in several EQ-5D-related projects at APERSU, including the validation of the EQ-5D-Y-5L among children with juvenile idiopathic arthritis.

PhD Abstract

Background Juvenile idiopathic arthritis (JIA) is the most common type of arthritis among children, and it can cause permanent physical damage to joints, affecting mobility, pain and daily activities. The 3-level self-reported version of EQ-5D-Y has been validated in patients with JIA, but the validity of the 5-level version remains unknown. Objectives Our first aim is to examine the performance of the EQ-5D-Y-5L parent-proxy version among children with JIA in terms of construct validity and informativity. Our second aim is to evaluate the responsiveness of the EQ-5D-Y-5L, and in particular, its ability to capture important effects of pain and function levels experienced by children with JIA. Proposed methods We will use data from the UCAN CAN-DU (Canada-Netherlands Personalized Medicine Network in Childhood Arthritis and Rheumatic Disease) study cohort, which includes patients with new-onset JIA, those starting or stopping biologics, and patients with hard-to-treat JIA. Patients in this cohort have a baseline visit and a follow-up visit (either six-month or twelve-month). Demographics, clinical outcomes, medical history, the parent-proxy version of the childhood health assessment questionnaire (CHAQ), the parent-proxy version of the EQ-5D-Y-5L, and the global rating of change scale (only at follow-up visits) are collected. We will use data from the baseline visit to examine the construct validity and informativity and data from both the baseline and follow-up visits to examine the responsiveness. Future research or innovations This validation study will help establish the validity of EQ-5D-Y-5L among children with JIA, providing evidence that the EQ-5D-Y-5L is appropriate for use among younger populations. This study will ultimately inform research that measures the quality of life impact of JIA and identifies treatments that improve the quality of life of these children.

Supervisors (roles): Paul Krabbe, PhD (Supervisor); Karin Vermeulen, PhD (Second supervisor)

PHD ABSTRACT
Background: Patient-reported outcome measures (PROMs) play an important role in measuring health-related quality of life (HRQoL), and further add advancement to health care. However, some concerns remain in many of the current PROMs, which can limit the accuracy and validity of these PROMs. These concerns include, for example, the content of items of the PROMs are not selected by patients but by experts, some important health items are not appropriately captured by the PROMs descriptive system, valuation techniques and statistical models used to process the responses from these techniques are complex and sensitive for biases. Some of these concerns may also exist in the most widely used generic PROM EQ-5D. A novel measurement model (multi-attribute preference response, MAPR) has been developed, based on this model, several patient-centered and preference-based PROMs were developed. Aims: Validating and improving new PROMs by applying them in the population study and comparing them head-to-head with EQ-5D. Methods: The MAPR model was used to develop PROMs, it is a probabilistic choice model that combines the Rasch model (item response theory) and the discrete choice model. PROMs within MAPR model: 1) CS-Base, generic PROM: 2) PUF-ULP, for patients using hand prosthesis; 3) Cardiovascular PROM, for patients with cardiovascular diseases. Samples: for different PROMs, we conducted studies among different populations. The CS-Base PROM was applied among USA patients with various diseases, the PUF-ULP PROM was applied among prosthesis users in the Netherlands. The Cardiovascular PROM was applied among Dutch patients with cardiovascular diseases. Study design: we applied PROMs developed within the MAPR model and EQ-5D among the same respondents in each study, comparing their performance in measuring HRQoL head-to-head, in aspects of the range of health items captured, the precision of coefficients, the sufficiency of description and discrimination of health states.

PHD ABSTRACT
The aim of my PhD project is to examine the desirability, feasibility, and impact of involving children in the valuation of EQ-5D-Y health states. We will explore the theoretical/normative and empirical underpinning of involving stakeholders, in particular children, in decisions in health and healthcare. Furthermore, the project will focus on whether and why child and adult members of the public, and policymakers in healthcare believe that involving children in the valuation of EQ-5D-Y health states would be desirable and feasible. Research will be conducted on the various ways in which children can potentially be involved in the valuation of EQ-5D-Y health states and the impact of such involvement on the value of health states.

PHD ABSTRACT
Composite time trade-off (cTTO) utilities have been found to be higher when adults value health states for children than for themselves. It is not clear if these differences reflect adults assigning truly higher utilities to the same health state in different perspectives, or if they are caused by other factors, which are not accounted for in the valuation procedure. One research has been granted by EuroQol, which aims to test if the difference between children’s and adults’ cTTO valuations changes if a longer duration than the standard 10 years is used. We intend to conduct personal interviews with a representative sample of 150 adults in the UK were conducted. We employ the cTTO method to estimate utilities of four different health states, where adults consider states both from their own and a 10-year-old child’s perspective, for durations of 10 and 20 years. We also correct the cTTO valuations for perspective-specific time preferences in a separate task, again for both perspectives.

PHD ABSTRACT
The tightening financial situation in Finland's health and social care sector, as well as the need of the professionals, are constantly hot topics in the speeches of decision-makers and in the general media. We are faced with an inevitable question: if the money and staff are not enough for everything, how do we choose the interventions for which the resources are used? The information collected by the quality of life (QoL) instrument alone cannot be used as a basis for prioritization, but it offers one more tool in the toolbox that aims to improve the quality and effectiveness of healthcare interventions. In Finland, many generic PROMs are being used and no national, uniform policy has been made. Certain QoL measures (i.e. generic PROMs) enable the calculation of quality-adjusted life years and provide us with information on how the intervention is reflected in the patient's or client's QoL. Disease-specific instruments capture usually more in-depth information on patient’s symptoms or health issues yet generic instruments allow comparisons between patient groups and thus are often preferred in health economics. In this dissertation, the differences and similarities of certain generic PROMs are examined, and the new Finnish population reference values for one of the most used generic PROMs are drawn up. Research articles 1. Finnish Population Reference Values for EQ-5D-5L using Danish Value set 2. The differences and similarities between different generic PROM tools; EQ-5D-5L, PROMIS Global Health and Overall Well-being – how do certain health states or individual’s lifestyle reflect to absence from work due to a health problem? 3. Does the QoL differ between people with or without disabilities? Which underlying factors affect individual’s QoL the most (EQ-5D-5L and EuroHIS-8)? 4. New Finnish Value Set for EQ-5D-5L (tentative)

PHD ABSTRACT
Background. In many countries, there are calls to address health inequalities experienced by
Indigenous people. Indirect generic preference-based measures (PBMs) of health-related
quality of life (HRQL), such as the EQ-5D, provide a measurement of individuals’ or populations’
health and can support resource allocation decisions. However, the usefulness of any PBM is
partially contingent on the appropriateness of the measure for the population in which it is used.
Indigenous people conceptualize health differently than traditional biomedical models of health,
so it is important to assess validity and reliability of PBMs in Indigenous populations. Objectives.
1) systematically examine the use of PBM in Indigenous people, 2) explore face and content
validity of the EQ-5D-5L and interpretation of traditional choice-based health valuation tasks for
Indigenous people, and 3) examine stated preferences for attributes of health based on the
EQ-5D-5L descriptive system and compare how preferences differ from non-Indigenous people.
Proposed Methods. I propose mixed methods, informed by a systematic review on the
application, development, and performance of PBM in Indigenous people. We will engage
Indigenous people as respected members of the study team. Face and content validity of the
EQ-5D-5L and interpretation of traditional choice-based health valuation tasks for
Indigenous people, and 3) examine stated preferences for attributes of health based on the
EQ-5D-5L descriptive system and compare how preferences differ from non-Indigenous people.

I have a bachelor's degree majoring in pharmaceutical sciences from the Faculty of Pharmacy, University of Health Sciences Lao PDR, and a master's degree in Advanced Drug Delivery Systems from Tianjin University of Traditional Chinese Medicine China. Before commencing my Ph.D., I have been working as a junior lecturer for the Faculty of Pharmacy, University of Health Sciences Lao PDR. Therefore, my Ph.D. research focuses on "Validating two Health-Related Quality-of-Life instruments for use in health technology assessment of interventions for stunted children in Laos".

DOCTORAL PROGRAM
The Faculty of Pharmacy, Social and Administrative Pharmacy, Silpakorn University, Nakhorn Pathom, Kingdom of Thailand, Expected completion in 2025
Supervisors (roles): Nan Luo, Main Thesis Advisor; Mayfong Mayxay, Co-Investigator; Elizabeth Ashley, Co-Investigator; Yot Teerawattananon, Co-Investigator; Sanyalack Saysanasongkham, Collaborator; Michael Herdman, Collaborator

PHD ABSTRACT
The project aims to develop the EuroQol Group’s child-friendly EQ-5D (EQ-5D-Y) and Toddler and Infant Population Scale (EQ-TIPS), two generic health-related quality of life (HRQoL) instruments, for use in stunted children in Laos. The overall aim is to localize the two instruments for assessment of the health burden related to stunting in Laos. The specific objectives are: 1. To develop a Lao version of the EQ-5D-Y questionnaire for use by proxies; 2. To assess the content validity of EQ-5D-Y and EQ-TIPS for measuring the HRQoL of Lao children under the age of 5; 3. To investigate construct validity and test-retest reliability of EQ-5D-Y and EQ-TIPS among parents of stunted children under the age of 5;

I am a PhD student and researcher with the Monash University Health Economics Group (MUHEG). My PhD is focused on the inclusion of carer outcomes (spillover) in health economic evaluations using the EQ-5D. I have a Masters degree in Health Economics and Bachelors degree in Nursing. I have contributed in several economic evaluation and programme evaluation projects in the area of mental health.

DOCTORAL PROGRAM
Monash University Health Economics Group, School of Public Health and Preventive Medicine, Monash University, Victoria, Australia, Expected completion in 2026
Supervisors (roles): Lidia Engel, PhD (Main Supervisor), Cathy Mihalopoulos, PhD (Co-supervisor), Gang Chen, PhD (Co-supervisor), Brendan Mulhern, PhD (Co-supervisor)

PHD ABSTRACT
Economic evaluations have traditionally considered only the costs and benefits of the person receiving care; however, recent guidelines now support the inclusion of broader impacts in economic evaluations, such as informal carer costs and benefits when adopting a societal perspective. While carer-specific preference-based measures are available for capturing carer impacts, there is increased interest from HTA bodies (e.g. NICE) to use the EQ-5D, ensuring consistency across evaluations and the ability to combine patient QALYs and carer QALYs using the same outcome measure. Incorporating carer outcomes or ‘spillover effects’ into economic evaluation requires further investigation into the extent of potential ‘double-counting’. Hence, there is an urgent need for further research to examine how carer QoL can be included in economic evaluations using the EQ-5D. The PhD’s aim is to address current methodological issues concerning the inclusion of carer outcomes in economic evaluation using the EQ-5D tools. The research will address a series of inter-related but distinct questions: (1) What is the psychometric performance of the EQ-5D tools in capturing carer outcomes for use in economic evaluation? (2) What is the extent of double-counting when including carer outcomes in economic evaluation using the EQ-5D? (3) Should ‘carer QALYs’ be weighted differently than ‘patient QALYs’ in economic evaluation? A systematic review on the psychometric properties of the EQ-5D in informal carers will be conducted to understand its performance in the carer population and identify potential gaps. Further, a study will be conducted examining the psychometric properties of the EQ-5D-5L compared with carer-specific preference-based measures in informal carers in Australia. Lastly a mixed-methods study will be conducted to explore the extent of double-counting when including carer outcomes in economic evaluations, and whether ‘carer QALYs’ should be weighted differently than ‘patient QALYs’.

School of Medicine and Public Health, The University of Newcastle, NSW, Australia, Expected completion in 2026; Supervisors (roles): Melissa Harris, PhD (Primary supervisor), John Atia, PHD, MD (Co-supervisor)

PHD ABSTRACT
Background: Non-cancer chronic diseases present a significant global health challenge, necessitating a nuanced approach to mortality prediction and intervention. This project identified easily available and measurable variables, particularly those related to health service use and health-related quality of life (HRQoL), as crucial indicators capturing the complex and dynamic nature of non-cancer chronic diseases (NCDs). Recognizing the substantial associations between changes in health service use and HRQoL over time and mortality outcomes underscores the need for a more comprehensive predictive model. Aims: The primary objective is to develop a robust predictive model for non-cancer chronic disease mortality by integrating diverse data sources. The incorporation of HRQoL measures may improves the precision of the model, leading to the development of a personalized risk stratification tool. This tool aims to facilitate the early identification of individuals at high risk, optimizing the timing of palliative care referral, and ultimately improving overall patient outcomes. Methods: Interdisciplinary methodologies, comprising advanced statistical modeling, and data integration techniques, form the foundation of this project. Rigorous validation processes, including cross-validation and sensitivity analyses, will be employed to ensure the reliability and generalizability of the predictive model. The inclusion of HRQoL measures not only expands our understanding of individual risk profiles but also enhances the overall accuracy of the predictive model.

PHD ABSTRACT
Resources in health care are scarce. Economic evaluations are required to allocate resources efficiently in health. In the domain of CUA, the main outcome is defined as quality-adjusted life years (QALYs) and the estimation of QALYs involves assessing both the quality and quantitative of life. While health-related quality of life instruments have been commonly used to measure quality of life, it is important to consider broader aspects of health including social outcomes like dignity and social participation. My PhD is part of a larger project that aims to combine existing instruments such as EQ-5D-5L and ASCOT into a broader descriptive system. Specifically, my research focuses on the valuation of the combined instrument using discrete choice experiments. This will provide decision-makers with a more comprehensive tool incorporating both health and social outcomes to achieve more equitable allocation of scarce health care resources.

BIOSKETCH  
Stevanus Pangestu is a PhD candidate at the Department of Health Policy of Corvinus University of Budapest, Hungary. His study is fully funded by the Stipendium Hungaricum scholarship and expected to be completed in 2025. He holds a BSc in Accounting and an MBA from Atma Jaya Catholic University of Indonesia. Prior to the enrollment in the PhD program, he was an assistant professor at Atma Jaya Catholic University of Indonesia (2017-2021). He also served as the Head University Strategist for 1.5 years. Stevanus’s research interests focus on the measurement of health-related quality of life and wellbeing in patients with cancer, with a special interest in financial wellbeing.

DOCTORAL PROGRAM  
Department of Health Policy, Corvinus University of Budapest, Budapest, Hungary (Expected Graduation 2025)  
Supervisors (roles): Professor Fanni Rencz, MD, PhD (Supervisor)

PHD ABSTRACT  
Cancer is a major leading cause of death worldwide. It accounts for a large proportion of global disease burden in terms of disability-adjusted life-years. Patients with cancer generally experience the decline of health-related quality of life (HRQOL) and wellbeing. Further, the diagnosis and treatment of cancer may also lead to financial toxicity, which is the impairment of financial wellbeing in patients. The purpose of this project is to: i) perform a systematic literature review and meta-analysis on studies investigating the association of financial toxicity and HRQOL in patients with cancer, ii) validate the EQ-HWB in cancer and compare its measurement properties with other outcome measures, including EQ-5D-5L, and iii) investigate the associations between financial toxicity, HRQOL, and wellbeing. For the first aim, a systematic literature review and meta-analysis will be performed in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guideline using PubMed, Web of Science, CINAHL, and PsycInfo. For the second and third aims, a longitudinal study will be performed among patients with cancer in Indonesia. Outcome measures in the survey will include the EQ-5D-5L, EQ-HWB, Functional Assessment of Cancer Therapy-General from which FACT-8D utilities can be derived, Short Warwick-Edinburgh Mental Wellbeing Scale, and Comprehensive Score for Financial Toxicity. To assess the measurement properties of the health and wellbeing measures, floor and ceiling, item informativity, validity (convergent, known-group, test-retest), and responsiveness will be tested. To assess the associations between financial toxicity and health and wellbeing outcomes, multivariate regressions will be used. This project will extend the literature on psychometric properties of EQ instruments, specifically within the patient group with cancer. Our research will also reveal association of financial toxicity with health and wellbeing outcomes in Indonesia.

BIOSKETCH
Dr Dan Youkee is an emergency medicine doctor and a PhD student at King's College London. Dan has lived and worked in Sierra Leone since 2014. His PhD focuses on the Impact of Stroke in Sierra Leone, supervised by Dr Iain Marshall and Prof Julia Fox-Rushby. As part of his PhD Dan led the translation of the Krio version of the EQ-5D-3L for Sierra Leone. Further work assesses the translation using an equivalence framework, assesses psychometric properties and reports utilities and quality-adjusted life years after stroke in Sierra Leone.

DOCTORAL PROGRAM
King's Global Health Partnerships, School of Population Health, King's College London, London/ Freetown, UK / Sierra Leone, Expected completion in 2024
Supervisors (roles): Iain Marshall, PhD MBBS (Lead supervisor), Julia Fox-Rushby, PhD (Second supervisor)

PHD ABSTRACT
86% of worldwide stroke mortality occurs in LMICs and is a targeted public health priority. However, evidence on the incidence and outcomes of stroke in low-income countries like Sierra Leone is limited. My PhD focuses on the impact of stroke in Sierra Leone, including mortality, functional outcome and health-related quality of life. The relevant parts of the thesis include the following three components: 1. Using an equivalence framework to translate and evaluate the EQ-5D-3L in Krio for Sierra Leone 2. The feasibility, reliability, validity and responsiveness of the EQ-5D-3L in Krio for stroke patients in Sierra Leone 3. Quality of Life and Quality adjusted Life years after stroke in Sierra Leone This work may help further define and update translation methods and processes. We trial new methods to assess the functional equivalence of the translated versions and reflect on the utility (or not) of additional methods used in the translation process.

EuroQol PhD Network Code of Conduct

Version 1.0 - 10 January 2022

The EuroQol PhD Network is committed to providing a safe, inclusive, welcoming, and harassment-free experience for everyone. We try to cultivate a community with shared values, where people are comfortable exploring ideas, asking questions, and saying things like “I don’t understand” or “Why”. There are no stupid questions.

Be considerate in speech and actions. Actively seek to acknowledge and respect the boundaries of people who participate in our activities. Refrain from demeaning, discriminatory, or harassing behavior and speech. Assume competence in the people you interact with.

Take care of each other. Alert the co-chairs (e.g., Joshua M. Bonsel, Benjamin M. Craig) if you notice a dangerous situation, someone in distress, or a potential violation of this Code of Conduct, even if it seems inconsequential. We do not tolerate harassment in any form. In particular, we prioritize marginalized people’s safety over privileged people’s comfort.

This Code of Conduct applies to all people participating in the community, to all modes of interaction, and to all events hosted or endorsed. If anyone engages in harassing behavior, the co-chairs will take action that may include warning the offender or asking them to leave an event or an online channel either temporarily or permanently, or seeking help from law enforcement.

We welcome your feedback by email, and we thank you for working with us to make the Network a safe, enjoyable, friendly and enriching experience for everyone who participates.

The EuroQol PhD Network Code of Conduct has been influenced by discussion during the EOWG PhD Roundtables held in Summer 2022 and the rOpenSci Code of Conduct, which can be found at their website, https://ropensci.org/code-of-conduct/.
